

House Price Prediction - Project Summary

Objective

Predict house prices using machine learning models and identify the most influential features.

Dataset

Housing Prices Dataset from Kaggle.

Models Used

- Linear Regression
- Random Forest Regressor

Results

Model	MAE	RMSE	R ²
Linear Regression	970043	1324507	0.653
Random Forest	1021546	1400566	0.612

Key Findings

- Area was the strongest predictor of price.
- Bathrooms and air conditioning significantly increased house value.
- Parking and number of stories also positively affected price.
- Linear Regression outperformed Random Forest on this dataset.

Recommendation

Real estate businesses should prioritize properties with larger living areas, multiple bathrooms, parking spaces, and modern amenities because these features have the greatest impact on market value.
